TDT4121 - Introduction to Algorithms

Srinivasa Rao Satti

Textbook

Algorithm Design

by Jon Kleinberg and <u>Éva Tardos</u>

Contents

- Chapter 1 Introduction: Some Representative Problems
- Chapter 2 Basics of Algorithm Analysis
- Chapter 3 Graphs
- Chapter 4 Divide and Conquer
- Chapter 5 Greedy Algorithms
- Chapter 6 Dynamic Programming
- Chapter 7 Network Flow
- <u>Chapter 8 NP and Computational Intractability</u>
- Chapter * Coping with NP hardness

Evaluation

- There will be **9** assignments, and you need to get at least **6** of them approved in order to qualify for the final exam.
- Assignments consist of both theoretical and programming-based problems.
- Final exam consists of only theoretical problems.

Chapter 1

Introduction: Some Representative Problems

PEARSON Addison Wesley Slides by Kevin Wayne. Copyright © 2005 Pearson-Addison Wesley. All rights reserved.

Algorithms

Algorithm.

- [webster.com] A procedure for solving a mathematical problem (as of finding the greatest common divisor) in a finite number of steps that frequently involves repetition of an operation.
- [Knuth, TAOCP] An algorithm is a finite, definite, effective procedure, with some input and some output.
- True origin: Abu 'Abd Allah Muhammad ibn Musa al-Khwarizm was a famous 9th century Persian author who wrote Kitab al-jabr wa'lmuqabala, which evolved into today's high school algebra text.

Great algorithms are the poetry of computation. Just like verse, they can be terse, allusive, dense, and even mysterious. But once unlocked, they cast a brilliant new light on some aspect of computing. - Francis Sullivan

1.1 A First Problem: Stable Matching

Matching Residents to Hospitals

Goal. Given a set of preferences among hospitals and medical school students, design a self-reinforcing admissions process.

Unstable pair: applicant x and hospital y are unstable if:

- x prefers y to its assigned hospital.
- y prefers x to one of its admitted students.

Stable assignment. Assignment with no unstable pairs.

- Natural and desirable condition.
- Individual self-interest will prevent any applicant/hospital deal from being made.

Goal. Given n men and n women, find a "suitable" matching.

- Participants rate members of opposite sex.
- Each man lists women in order of preference from best to worst.
- Each woman lists men in order of preference from best to worst.

Men's Preference Profile

Perfect matching: everyone is matched monogamously.

- Each man gets exactly one woman.
- Each woman gets exactly one man.

Stability: no incentive for some pair of participants to undermine assignment by joint action.

- In matching M, an unmatched pair m-w is unstable if man m and woman w prefer each other to current partners.
- ^D Unstable pair m-w could each improve by eloping.

Stable matching: perfect matching with no unstable pairs.

Stable matching problem. Given the preference lists of n men and n women, find a stable matching if one exists.

Q. Is assignment X-C, Y-B, Z-A stable?

Men's Preference Profile

- Q. Is assignment X-C, Y-B, Z-A stable?
- A. No. Bertha and Xavier will hook up.

Men's Preference Profile

Men's Preference Profile

Stable Roommate Problem

- Q. Do stable matchings always exist?
- A. Not obvious a priori.

Stable roommate problem.

- ^D 2n people; each person ranks others from 1 to 2n-1.
- Assign roommate pairs so that no unstable pairs.

	1 st	2 nd	3 rd
Adam	В	С	D
Bob	С	А	D
Chris	А	В	D
Doofus	А	В	С

Observation. Stable matchings do not always exist for stable roommate problem.

Propose-And-Reject Algorithm

Propose-and-reject algorithm. [Gale-Shapley 1962] Intuitive method that guarantees to find a stable matching.

```
Initialize each person to be free.
while (some man is free and hasn't proposed to every woman) {
   Choose such a man m
   w = 1<sup>st</sup> woman on m's list to whom m has not yet proposed
   if (w is free)
        assign m and w to be engaged
   else if (w prefers m to her fiancé m')
        assign m and w to be engaged, and m' to be free
   else
        w rejects m
}
```

Proof of Correctness: Termination

Observation 1. Men propose to women in decreasing order of preference.

Observation 2. Once a woman is matched, she never becomes unmatched; she only "trades up."

Claim. Algorithm terminates after at most n² iterations of while loop. Pf. Each time through the while loop a man proposes to a new woman. There are only n² possible proposals.

	1st	2 nd	3 rd	4 th	5 th		1 ^{s†}	2 nd	3 rd	4 th	5 th
Victor	A	В	С	D	E	Amy	W	х	У	Z	V
Wyatt	В	С	D	A	E	Bertha	Х	У	Z	V	W
Xavier	С	D	А	В	E	Clare	У	Z	V	W	Х
Yancey	D	A	В	С	E	Diane	Z	V	W	х	У
Zeus	A	В	С	D	E	Erika	V	W	Х	У	Z

n(n-1) + 1 proposals required

Proof of Correctness: Perfection

Claim. All men and women get matched.

- Pf. (by contradiction)
 - Suppose, for sake of contradiction, that Zeus is not matched upon termination of algorithm.
 - Then some woman, say Amy, is not matched upon termination.
 - By Observation 2, Amy was never proposed to.
 - But, Zeus proposes to everyone, since he ends up unmatched.

Proof of Correctness: Stability

Claim. No unstable pairs.

- Pf. (by contradiction)
- Suppose A-Z is an unstable pair: each prefers each other to partner in Gale-Shapley matching S*.
- Case 1: Z never proposed to A. \Rightarrow Z prefers his GS partner to A. \Rightarrow A-Z is stable. Case 2: Z proposed to A. \Rightarrow A rejected Z (right away or later) and barrener barre
 - \Rightarrow A prefers her GS partner to Z. \leftarrow women only trade up
 - \Rightarrow A-Z is stable.
- □ In either case A-Z is stable, a contradiction. ■

Summary

Stable matching problem. Given n men and n women, and their preferences, find a stable matching if one exists.

Gale-Shapley algorithm. Guarantees to find a stable matching for any problem instance.

- Q. How to implement GS algorithm efficiently?
- Q. If there are multiple stable matchings, which one does GS find?

Efficient Implementation

Efficient implementation. We describe $O(n^2)$ time implementation.

Representing men and women.

- Assume men are named 1, ..., n.
- Assume women are named 1', ..., n'.

Engagements.

- Maintain a list of free men, e.g., in a queue.
- Maintain two arrays wife[m], and husband[w].
 - set entry to ${\scriptstyle 0}$ if unmatched
 - if m matched to w then wife[m]=w and husband[w]=m

Men proposing.

- For each man, maintain a list of women, ordered by preference.
- Maintain an array count[m] that counts the number of proposals made by man m.

Efficient Implementation

Women rejecting/accepting.

- Does woman w prefer man m to man m'?
- For each woman, create inverse of preference list of men.
- Constant time access for each query after O(n) preprocessing.

Amy	1 st	2 nd	3 rd	4 th	5 th	6 th	7 th	8 th
Pref	8	3	7	1	4	5	6	2
Amy	1	2	3	4	5	6	7	8
Inverse	4 th	8 th	2 nd	5 th	6 th	7 th	3 rd	1 ^{s†}

Amy prefers man 3 to 6 since inverse[3] < inverse[6]

2 7

Understanding the Solution

Q. For a given problem instance, there may be several stable matchings. Do all executions of Gale-Shapley yield the same stable matching? If so, which one?

An instance with two stable matchings.

- □ A-X, B-Y, C-Z.
- □ A-Y, B-X, C-Z.

Understanding the Solution

Q. For a given problem instance, there may be several stable matchings. Do all executions of Gale-Shapley yield the same stable matching? If so, which one?

Def. Man m is a valid partner of woman w if there exists some stable matching in which they are matched.

Man-optimal assignment. Each man receives best valid partner.

Claim. All executions of GS yield man-optimal assignment, which is a stable matching!

- No reason a priori to believe that man-optimal assignment is perfect, let alone stable.
- ^a Simultaneously best for each and every man.

Man Optimality

Claim. GS matching S* is man-optimal.

- Pf. (by contradiction)
 - Suppose some man is paired with someone other than best partner.
 Men propose in decreasing order of preference ⇒ some man is rejected by valid partner.
 - Let Y be first such man, and let A be first valid woman that rejects him.
 - Let S be a stable matching where A and Y are matched.
 - When Y is rejected, A forms (or reaffirms)
 engagement with a man, say Z, whom she prefers to Y.
 - Let B be Z's partner in S.
 - Z is not rejected by any valid partner at the point when Y is rejected by A. Thus, Z prefers A to B.
 - But A prefers Z to Y.
 - □ Thus A-Z is unstable in S. ■

since this is first rejection by a valid partner

S Amy-Yancey Bertha-Zeus . . .

Stable Matching Summary

Gale-Shapley algorithm. Finds a stable matching in $O(n^2)$ time.

Man-optimality. In version of GS where men propose, each man receives best valid partner.

w is a valid partner of m if there exist some stable matching where m and w are paired

Q. Does man-optimality come at the expense of the women?

Woman Pessimality

Woman-pessimal assignment. Each woman receives worst valid partner.

Claim. GS finds woman-pessimal stable matching S*.

Pf.

- Suppose A-Z matched in S*, but Z is not worst valid partner for A.
- There exists stable matching S in which A is paired with a man, say
 Y, whom she likes less than Z.
- Let B be Z's partner in S.
- □ Z prefers A to B. ← man-optimality
- Thus, A-Z is an unstable in S.

S

Amy-Yancey Bertha-Zeus

Extensions: Matching Residents to Hospitals

Ex: Men \approx hospitals, Women \approx med school residents.

Variant 1. Some participants declare others as unacceptable.

Variant 2. Unequal number of men and women.

Variant 3. Limited polygamy.

hospital X wants to hire 3 residents

resident A unwilling to

work in hospital Z

Def. Matching S unstable if there is a hospital h and resident r such that:

- h and r are acceptable to each other; and
- either r is unmatched, or r prefers h to her assigned hospital; and
- either h does not have all its places filled, or h prefers r to at least one of its assigned residents.

1.2 Five Representative Problems

Interval Scheduling

Input. Set of jobs with start times and finish times. Goal. Find maximum cardinality subset of mutually compatible jobs.

jobs don't overlap

Weighted Interval Scheduling

Input. Set of jobs with start times, finish times, and weights. Goal. Find maximum weight subset of mutually compatible jobs.

Bipartite Matching

Input. Bipartite graph. Goal. Find maximum cardinality matching.

Independent Set

Input. Graph. Goal. Find maximum cardinality independent set. subset of nodes such that no two joined by an edge

Competitive Facility Location

Input. Graph with weight on each each node.

Game. Two competing players alternate in selecting nodes. Not allowed to select a node if any of its neighbors have been selected.

Goal. Select a maximum weight subset of nodes.

Second player can guarantee 20, but not 25.

Five Representative Problems

Variations on a theme: independent set.

Interval scheduling: n log n greedy algorithm.
 Weighted interval scheduling: n log n dynamic programming algorithm.
 Bipartite matching: n^k max-flow based algorithm.
 Independent set: NP-complete.
 Competitive facility location: PSPACE-complete.

Extra Slides

Goal: Given n men and n women, find a "suitable" matching.

- Participants rate members of opposite sex.
- Each man lists women in order of preference from best to worst.
- Each woman lists men in order of preference from best to worst.

Men's Preference List

Goal: Given n men and n women, find a "suitable" matching.

- Participants rate members of opposite sex.
- Each man lists women in order of preference from best to worst.
- Each woman lists men in order of preference from best to worst.

Women's Preference List

Deceit: Machiavelli Meets Gale-Shapley

- Q. Can there be an incentive to misrepresent your preference profile?
 - Assume you know men's propose-and-reject algorithm will be run.
 - Assume that you know the preference profiles of all other participants.

Fact. No, for any man; yes, for some women. No mechanism can guarantee a stable matching and be cheatproof.

MS. MACHIAVELLI AND THE STABLE MATCHING PROBLEM

DAVID GALE

Department of Mathematics, University of California, Berkeley, California 94720

MARILDA SOTOMAYOR*

Department of Mathematics, Pontificia Universidade Catolica do Rio de Janeiro, Brazil

This paper is a sequel to a paper, "Machiavelli and the Gale-Shapley Algorithm," written by Dubins and Freedman [1] in 1981. That paper was, in turn, a sequel to "College Admissions and the Stability of Marriage," by Gale and Shapley [2], 1962. For the benefit of readers who may have missed the previous installments, a brief recapitulation is given in the following section.

1. The Story So Far. Paper [2] above was concerned with a situation in which there are two sets of "agents", such as students and universities or workers and employees, or women and men.

THEOREM 1. If there is more than one stable matching, then there is at least one woman who will be better off by falsifying, assuming the others tell the truth.
